BhumiSetu

India's Land Decision Infrastructure

Master Product Requirements Document

Parts 1 to 3: Strategy, Market Research, and Personas

Document Grade: Investor & Engineering Ready

Date: July 2026

PART 1: STRATEGY & VISION

1. Executive Summary

BhumiSetu is the fundamental operating system for India's land ecosystem. While existing prop-tech platforms have saturated the "discovery" layer (listings and brokerage), the "decision and execution" layer remains fragmented, opaque, and fraught with legal and financial peril. BhumiSetu solves this by combining AI-driven document intelligence, geospatial mapping, and automated workflow coordination with a verified network of on-ground professionals (surveyors, lawyers, and documentation agents). We do not sell surveys or legal documents; we sell **confidence and clarity** in land transactions.

2. Mission & Vision

Mission: To build India's AI-powered Land Decision Platform, reducing uncertainty through structured intelligence, workflow automation, and trusted professionals.

Vision: Imagine the API infrastructure of Stripe, the intelligence of Palantir, the spatial awareness of Google Maps, and the workflow engine of Notion—all orchestrated by AI agents for India's land ecosystem. We are building the default infrastructure upon which all future land transactions and decisions will be executed.

3. Market & Product Thesis

Market Thesis: The Indian real estate market is transitioning from a high-friction, low-trust environment to a digitized, formalized sector (catalyzed by RERA, ULPIN, and digital land records). However, raw government data is unstructured and difficult to interpret. The market needs a translation and execution layer.

Product Thesis: Users cannot synthesize complex legal history, geospatial anomalies, and field realities on their own. By packaging these inputs into a single "Trust Score" and actionable workflows, BhumiSetu abstracts the complexity of land diligence into a seamless, digital-first experience.

4. Category Design

BhumiSetu is deliberately stepping out of "PropTech/Listings" and defining a new category: **Land Decision Infrastructure**. We are a B2B2C and B2B SaaS + Marketplace hybrid. We are the intelligence and execution layer that sits *between* discovery and transaction.

5. Business Model

> **Model Improvement: Tri-partite Monetization**
>
> Instead of a simple transactional model, BhumiSetu will employ a multi-layered monetization engine to maximize LTV and build recurring revenue:
>
> - **Retail (B2C):** High-margin, fixed-fee execution packages (e.g., "Complete Land Diligence Protocol" at ₹15,000).
> - **Enterprise (B2B SaaS):** API access and Seat-based licensing for NBFCs, Banks, and Solar companies for bulk underwriting and land acquisition workflows.
> - **Network Take-Rate:** A 15% platform fee on all professional services (legal drafting, surveying) routed through our Partner Network.

6. Economic Moat & Network Effects

Technology alone is easily replicated. BhumiSetu's moats are deeply structural:

- **The Land Decision Graph:** Every transaction adds to our proprietary database linking parcels, historic owners, encumbrances, and verified coordinates.
- **AI Learning Loop:** Our Document Agent becomes exponentially better at parsing vernacular land records (7/12, Khatauni) with every document processed.
- **Cross-Side Network Effect:** More verified lawyers/surveyors attract more enterprise clients looking for pan-India execution. More enterprise volume guarantees income for partners, locking them into the BhumiSetu ecosystem.

7. AI Strategy

AI should **organize, analyze, summarize, recommend, coordinate, and learn**. It does not replace the human professional. Human experts remain accountable for legal binding and physical verification. Our AI (Document Agents, Workflow Agents) acts as a high-speed paralegal and dispatcher, reducing processing time by 90% and eliminating human error in data entry.

8. Success Metrics (North Stars)

- **Primary:** Time-to-Resolution (TTR) for land diligence cases (Goal: Reduce from 45 days to 5 days).
- **Quality:** Zero defect rate in legal encumbrance identification.
- **Scale:** Number of parcels mapped and verified in the Land Decision Graph.

PART 2: MARKET RESEARCH

1. Indian Land Industry Context & Market Size

India’s real estate sector is projected to reach $1 Trillion by 2030. Land transactions account for a significant portion of this, yet nearly 66% of civil cases in India are land/property disputes. The total addressable market (TAM) for land diligence, surveying, and legal advisory is estimated at $4.5 Billion annually.

2. Customer Psychology & Behavioral Economics

The "Fear of Ruin" Heuristic: Land buyers do not optimize for the absolute best deal; they optimize to prevent a total loss of capital due to fraud or litigation. They exhibit high anxiety and low trust. BhumiSetu must design for *Trust Architecture*—every UI element, status update, and AI explanation must project institutional certainty.

3. Jobs To Be Done (JTBD)

- *"When I am buying a plot of land, help me uncover any hidden legal or physical issues, so I can invest my life savings without losing sleep."*
- *"When I am a solar developer acquiring 500 acres, help me orchestrate 50 local surveyors and lawyers simultaneously, so I can meet my project deployment deadlines."*

4. Competitor & Gap Analysis

Competitor Type	Examples	Strengths	Weaknesses / The Gap
Listing Portals	99Acres, MagicBricks	Massive distribution, discovery	Zero involvement in diligence, high fraud rate on listings, no workflow automation.
Local Brokers / Lawyers	Unorganized Sector	Local context, human relationship	Opaque pricing, extremely slow, zero tech integration, single point of failure.
Pure GIS SaaS	Esri, RMSI	Deep spatial capabilities	Not built for consumer/retail use cases, lacks legal document synthesis.

PART 3: PERSONAS & EMPATHY MAPS

1. Primary Personas

Persona A: The Anxious Retail Buyer (Ravi, 42, IT Manager)

Background: Looking to buy a 2-acre farm plot near Pune. First-time land buyer.

Pain Points: Cannot read Marathi 7/12 extracts. Afraid the broker is hiding an active court case. Doesn't know how to verify if the physical boundaries match the government map.

Goals: Needs absolute certainty. Wants a digital "green light" before transferring ₹50 Lakhs.

Decision Journey: Discovery (Portal) -> Doubt (Broker interaction) -> Search for Verification (BhumiSetu) -> Purchase execution.

Persona B: The Remote NRI Owner (Priya, 38, Doctor in UK)

Background: Inherited 5 acres in Punjab. Visits India once every 3 years.

Pain Points: Constant fear of squatter encroachment. Cannot fly down to handle boundary disputes or government paperwork.

Goals: Remote asset monitoring. Wants to order a digital perimeter survey and legal health check from her phone in London.

2. Secondary Personas (The Supply Side)

Persona C: The Tech-Forward Surveyor (Amit, 29)

Background: Operates a DGPS survey business in tier-2 city.

Pain Points: Inconsistent lead flow. Spends 40% of time chasing clients for payments and formatting AutoCAD PDFs.

Goals: Wants predictable, high-volume work. Prefers an app that tells him exactly where to go, automates the report generation, and guarantees payout within 24 hours.

3. Enterprise Persona

Persona D: The NBFC Underwriter (Sunita, 45, Risk Manager)

Background: Sanctions Loans Against Property (LAP) for rural land.

Pain Points: Taking 30+ days to get physical search reports from local empaneled lawyers. High turnaround time is losing them clients to faster banks.

Goals: Needs an API/Dashboard where she inputs a Survey Number and instantly gets an AI-summarized legal risk score, backed by a human lawyer's digital signature.
